Ivar Cashin Eriksson

Hello Electricity Maps team,

I am writing to apply for the Senior Data Scientist, Price Forecasting role in Copenhagen. I am a data scientist with seven years of experience across forecasting, production machine learning, pharmaceutical analytics, healthcare AI, and energy-related consulting work. The role interests me because it combines several things I care about: statistical modelling, real production systems, and work where better forecasts can support better decisions in a complex physical market.

My current work at Signum Life Science is on price and demand forecasting in noisy, incentive-driven markets. I maintain and improve a pharmaceutical price forecasting model for Denmark's fortnightly blind auctions and I am building an end-to-end Databricks forecasting platform designed to support configurable features, probabilistic forecasts, and thousands of simultaneously running models. While this is not a power-market model, the practical challenges are closely related: sparse and shifting signals, changing incentives, model degradation, and forecasts that need to support commercial decisions.

In addition, I worked on a Facebook Prophet based forecasting system for Pandora's highly volatile yearly sales cycle. We chose Facebook Prophet since it has been shown to be robust to missing data and supported our usecase well with many different exogenous variables in the form of seasonal shopping behaviours and frequent promotions.

I have also built and maintained production ML systems beyond forecasting. At Valcon, I architected and implemented an end-to-end production pipeline for a real-time neural network using natural-language inputs and high-dimensional labels. I also mentored colleagues, led trainings, and regularly explained modelling work to non-technical stakeholders. Earlier, at RaySearch Laboratories, I worked on probabilistic modelling and optimisation for automated radiotherapy planning, using autoencoders and sparse Gaussian processes on segmented 3D CT scans. That work made me comfortable with models whose outputs need to be useful in real decision workflows, not only accurate on paper.

My background is grounded in statistics and applied mathematics. I studied Engineering Physics and Statistical Learning and Data Analytics at The Royal Institute of Technology in Stockholm, with coursework including Statistical Machine Learning, Applied Time Series, and Optimization, and later spent an exchange period in Applied Mathematics at ETH.

What I can offer is strong experience in forecasting, production ML, MLflow, Scikit-learn, and Python-based data science, stakeholder-facing model delivery.

I would welcome the opportunity to discuss how my forecasting and production ML background could be useful to the team. Regards,

Ivar Cashin Eriksson.
