Ivar Cashin Eriksson

Hello,

I am writing to express my interest in contributing to Quantum Foundry Copenhagen in a technical role where my background in physics, applied machine learning, and data engineering can be useful. Your work on quantum processor manufacturing is exactly the kind of interdisciplinary engineering environment I am looking for: close to research, grounded in physical systems, and dependent on careful experimentation, automation, and reliable data.

My formal background is Engineering Physics from the Royal Institute of Technology (KTH), followed by a master's specialisation in Statistical Learning and Data Analytics. I graduated with a 5.0/5.0 GPA, with coursework including Quantum Physics, Solid State Physics, and Electromagnetic Theory as well as machine learning. During an exchange at Zhejiang University, I worked with a local research group on integrated photonic circuits, fabricating microring resonators and tuning their resonance frequency with controlled laser pulses to selectively remove cladding material. That work gave me hands-on experience with optical setups, lab instrumentation, device modification, and the importance of repeatable experimental protocols.

Professionally, I have focused on making applied ML and data systems reliable enough for real use. At Signum Life Science, I am building a Databricks forecasting platform for pharmaceutical price and demand. At Valcon, I architected an end-to-end production pipeline for a real-time neural network and led projects across pharma, energy, IoT, and manufacturing. Earlier, at RaySearch Laboratories, I worked on automated radiotherapy planning using autoencoders, sparse Gaussian processes, and optimisation on segmented 3D CT scans, in close collaboration with medical physicists and clinicians.

I believe this combination could be valuable in several parts of a quantum-foundry environment: Python-based automation, data acquisition and logging, analysis of experimental results, extraction of performance metrics, modelling of complex systems, and collaboration between experimental scientists, engineers, and software-oriented teams. I would also be very motivated to deepen my direct work with quantum hardware, photonics, characterization, and related laboratory workflows.

Outside work, I spend much of my time designing and building physical objects through woodworking and 3D printing. This reflects the same practical, curious, and creative engineering mindset I would bring to a hands-on research and engineering team.

Thank you for your consideration. I would be grateful for the opportunity to discuss whether my profile could be useful to Quantum Foundry Copenhagen, either now or as future roles develop. Regards,

Ivar Cashin Eriksson.
