Ivar Cashin Eriksson

Hello Flatpay team,

I am writing to apply for the Senior Data Scientist role. I am a data scientist and project manager based in Copenhagen, with experience building production AI systems across Databricks-based forecasting, LLM embedding and retrieval workflows, explainable AI, and computer vision. My toolkit includes Python, SQL, Databricks, MLflow, AWS, and Azure, and I am used to owning work from ambiguous problem framing through implementation, productionisation, and stakeholder adoption.

At Signum, I maintain and develop a pharmaceutical price forecasting platform and work on LLM embedding and retrieval workflows for semantic matching, enrichment, and decision support in domain-specific pharmaceutical data. The work includes evaluating semantic similarity, analysing retrieval failures, and improving matching quality. The platform is built around Databricks and designed for scalability, reliability, and many simultaneous forecasts generated by independently trained models. My role spans architecture, project management, data science, ML engineering, and software engineering. I also took over a next-best-action system for sales representatives and extended it with explainable AI features in collaboration with UX designers, so users could better understand and use the recommendations in customer-facing workflows.

At Valcon, I built and helped own production ML systems including a real-time deep neural network pipeline and an invoice quality-control system. The invoice system reached a response time of around two seconds in production and captured over 50 business processes. I also mentored junior colleagues, led explainable AI and Git trainings, and regularly presented technical work to non-technical stakeholders.

I am also interested in the image-processing side of the role. In Project iris, I built an end-to-end computer vision and retrieval system for e-commerce imagery using YOLOv8, OpenCLIP, FastAPI, MongoDB, Qdrant, and a Chromium extension. The system combined object detection, semantic embeddings, vector search, backend APIs, persistence, and browser-facing interaction. I explored it through H&M's startup ecosystem, including customer discovery, product scoping, and market validation.

Flatpay's focus on production GenAI, practical ownership, and measurable business value is close to the kind of applied work I find most engaging. I would welcome the opportunity to discuss how my background in production ML, LLM retrieval workflows, computer vision, and stakeholder-facing delivery could be useful.

Regards,
Ivar Cashin Eriksson.
